

```

public String[] insults(int n)
{
    // make String array
    String[] multi = new String[n];
    // insert insult into array
    // in a loop
    for (int i = 0; i < n; i++)
        multi[i] = insult(i);

    // return String array
    return multi;
}

```

```
String a = insult();  
multi[i] = a;
```

while solution

```
int i = 0;
```

```
while (i < n)
```

```
{
```

```
    multi[i] = insult();
```

```
    i++;
```

```
}
```

```
public void printInsults (int n)
{
```

2 ways :

① use `insult()`  
print instead of  
loading array

② use `insults(n)`  
print elements  
of array.
